F1 RACING ANALYTICS

PROBLEM STATEMENT, OBJECTIVES AND SCOPE

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Problem statement

Formula 1 data contains multiple connected dimensions: teams, drivers, race outcomes, tyres, circuits, countries and podiums. Reviewing these dimensions separately can make comparisons difficult. F1 Racing Analytics addresses this presentation and exploration problem by bringing nine Tableau views into one dashboard and adding a focused driver-points story.

Primary objective

Provide an accessible interactive view of Formula 1 performance and participation data, with a broad dashboard and a focused driver-points leaderboard.

Specific objectives

1. Present headline coverage indicators: teams, seasons, race outcomes and circuits. 2. Provide nine analytical views covering reliability, driver and team performance, championship analysis, tyre compounds, country participation and podium analysis. 3. Enable a Top N control in the driver-points story. 4. Embed Tableau Public outputs in a responsive website. 5. Explain the purpose of the dashboard and story to visitors.

Intended users

Formula 1 followers, students, data-visualization learners and evaluators who want to explore driver, team and race-related patterns through interactive charts.

Scope

The published site identifies a 17-season dataset scope, 10 teams, 6,464 race outcomes and 29 circuits. The precise calendar years and the source's definition of 'race outcomes logged' are not specified in the supplied HTML.

Out of scope / not evidenced

Live telemetry, real-time race timing, race-outcome prediction, machine learning, causal inference, tyre degradation modeling, weather analysis and automated data ingestion are not described in the supplied site. They should not be represented as completed features.

Success criteria

The dashboard and story load from Tableau Public; all nine dashboard views are accessible; the Top N story control changes the leaderboard; KPI labels match the documented coverage; the website navigation and responsive layout work at desktop and mobile widths.
