F1 RACING ANALYTICS

PRODUCT BACKLOG AND PROJECT RISK REGISTER

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Backlog item 1 — KPI overview

As a visitor, I want to see teams, seasons, race outcomes and circuits at a glance. Evidence: four KPI cards in the Overview section. Acceptance: all four values and labels display clearly.

Backlog item 2 — Interactive dashboard

As a visitor, I want one place to explore the nine F1 analytical views. Evidence: embedded Tableau dashboard. Acceptance: shared view loads and the available views can be explored.

Backlog item 3 — Reliability and performance analysis

As a visitor, I want to inspect reliability patterns. Evidence: dashboard description names reliability as one of its analytical perspectives.

Backlog item 4 — Driver and team analysis

As a visitor, I want to compare driver and team performance. Evidence: dashboard description explicitly identifies both.

Backlog item 5 — Championship and tyre analysis

As a visitor, I want to explore championship analysis and tyre compounds. Evidence: dashboard description names these views.

Backlog item 6 — Country and podium analysis

As a visitor, I want to inspect country participation and podium analysis. Evidence: dashboard description names both.

Backlog item 7 — Driver leaderboard story

As a visitor, I want to compare leading drivers by points and adjust Top N. Evidence: Story section describes the parameter control.

Backlog item 8 — Responsive presentation

As a mobile visitor, I want the page and embedded views to fit my screen. Evidence: responsive CSS breakpoints and mobile-specific embed heights.

Risk register

Risk: Tableau embed unavailable — mitigation: test public links and retain direct links. Risk: embedded view renders too tall/short — mitigation: test desktop/mobile heights. Risk: KPI mismatch — mitigation: reconcile displayed values with source workbook before updates. Risk: third-party asset failure — mitigation: verify local Bootstrap files and provide robust fallbacks.

Priority interpretation

The backlog is derived from the visible website features. It is not a historical sprint log and does not claim the original order, owners or completion dates.
