F1 RACING ANALYTICS

FUNCTIONAL TESTING AND VALIDATION

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Test scope

The HTML supports test planning for navigation, KPI presentation, dashboard embedding, story embedding, Top N interaction, responsive layout and footer year display.

TC-01 — Page identity

Expected: browser title reads F1 Racing Analytics | Race Data, Visualized. Evidence: title element in the HTML.

TC-02 — KPI values

Expected: overview shows 10 competing teams, 17 seasons, 6,464 race outcomes logged and 29 circuits showcased. Evidence: KPI card markup.

TC-03 — Dashboard embed configuration

Expected: placeholder viz1792514373277 references Tableau shared view 9Z3NGD45Z and has responsive dimensions. Evidence: embed object and JavaScript configuration.

TC-04 — Story embed configuration

Expected: placeholder viz1792514299867 references Tableau shared view JJ57Z8NDB and has responsive dimensions. Evidence: embed object and JavaScript configuration.

TC-05 — Top N story behavior

Expected: changing the Top N parameter changes the number of drivers shown. The website describes this behavior; runtime confirmation requires opening the published story.

TC-06 — Navigation

Expected: Home, Overview, Dashboard and Story links navigate to the matching page anchors.

TC-07 — Responsive layout

Expected: below 991px the KPI grid and story layout adapt; below 575px card and heading sizes are adjusted.

Test execution status

The source file proves that the markup and configuration exist. It does not prove that the live Tableau views loaded successfully on a particular device or that the interactive behavior was executed. Record runtime results separately.
