F1 RACING ANALYTICS

PERFORMANCE, USABILITY AND RESPONSIVE REVIEW

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Performance design

The Tableau embed script is loaded asynchronously after the page markup. The page uses display_spinner and display_static_image parameters and provides a note telling visitors to wait while the dashboard loads.

Configured visualization dimensions

Dashboard desktop height: 3027px; mobile height: 3627px. Story desktop height: 991px; mobile height: 1100px. Both visualization objects are set to width 100%.

Responsive breakpoints

At max-width 991px the hero padding is reduced, KPI cards switch to two columns, story content stacks and section headings align vertically. At max-width 575px navigation, card padding, typography and visualization frame styling are compacted.

Usability strengths

Clear calls to action; sticky navigation; consistent visual theme; KPI summary before detailed analysis; explanatory labels around the Tableau embeds; dedicated story explanation and Top N guidance.

Potential usability concerns

The dashboard's configured height is substantial and may require significant scrolling. Embedded Tableau controls depend on Tableau's own interface. External assets and network access affect the full experience.

Performance measurements

No page-load timings, Tableau render timings, filter-response measurements, CPU usage or network benchmarks are present in the HTML. No numerical performance score is claimed.

Recommended execution checks

Test on desktop and mobile; measure first contentful paint and full Tableau render separately; verify that the dashboard does not clip; verify Top N response; check keyboard navigation and contrast; record browser, device and network conditions.
