F1 RACING ANALYTICS

FINAL PROJECT REPORT

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Abstract

F1 Racing Analytics is an interactive Formula 1 data exploration project presented through a responsive website and Tableau Public visualizations. The website reports coverage of 10 competing teams, 17 seasons, 6,464 race outcomes and 29 circuits. Its Tableau dashboard contains nine views described as covering reliability, driver and team performance, championship analysis, tyre compounds, country participation and podium analysis. A separate Tableau Story, Driver Points Leaderboard, compares accumulated driver points and provides a Top N parameter to adjust the number of drivers shown. The website is implemented in HTML, CSS and JavaScript, uses Bootstrap assets and embeds Tableau Public views. The supplied source does not specify the raw dataset provider, exact season years, detailed formulas or measured findings; those are not asserted in this report.

Introduction

Formula 1 produces rich records about drivers, constructors, races, circuits, tyres and championship outcomes. F1 Racing Analytics aims to make several of these dimensions easier to explore by consolidating the analytical views in a Tableau dashboard and presenting them through a purpose-built website.

Problem and solution

The analytical challenge is to make multi-dimensional motorsport information accessible. The project solution combines a high-level KPI summary, a nine-view Tableau dashboard and a focused driver points story.

System implementation

The website is a single HTML page with embedded CSS and JavaScript. Bootstrap and Bootstrap Icons are referenced as local assets; Google Fonts supplies DM Sans and Space Grotesk. Tableau Public embeds are initialized through the Tableau JavaScript visualization API.

Results supported by source

The published site displays the four KPI values and describes the dashboard topics and leaderboard interaction. It does not publish specific driver rankings, race findings, chart values or statistical conclusions in the HTML text.

Conclusion

The supplied implementation provides an organized entry point into F1 data analysis and connects a broad dashboard with a focused driver-points story. The main contribution evidenced by the site is the presentation and interactive exploration experience. Further analytical claims require direct inspection of the workbook and underlying data.

Future scope

Document dataset provenance and exact coverage; publish a field-level data dictionary; explain metric formulas; add accessible direct links to Tableau views; provide downloadable methodology; test mobile embed sizing; record performance measurements; and add verified findings from the actual dashboard.
