F1 RACING ANALYTICS

VIVA QUESTIONS AND ANSWERS

Project	F1 Racing Analytics — Race Data, Visualized
Source basis	Supplied f1_racing_analytics.html and its embedded Tableau references
Document status	Completed project-specific documentation based on available source evidence

Document basis and evidence boundary

This document is populated from the supplied F1 Racing Analytics index.html. It uses the project's own wording and published KPI values. Where the HTML does not expose underlying data, formulas, workbook details or test results, that limitation is stated explicitly instead of inventing project facts.

Q1. What is the project title?

F1 Racing Analytics — Race Data, Visualized.

Q2. What is the main purpose?

To provide an interactive look into Formula 1 performance, including driver points, team rankings, race outcomes, tyre strategies, podiums and circuits.

Q3. What are the four headline KPIs?

10 competing teams, 17 seasons, 6,464 race outcomes logged and 29 circuits showcased.

Q4. How many views are in the dashboard?

The website describes nine views.

Q5. Which analytical topics are named?

Reliability, driver and team performance, championship analysis, tyre compounds, country participation and podium analysis.

Q6. What is the Tableau Story about?

It is a Driver Points Leaderboard that compares leading drivers by accumulated points.

Q7. What is Top N?

A parameter control that changes how many drivers appear in the leaderboard.

Q8. Which platform hosts the visualizations?

Tableau Public.

Q9. What is the dashboard shared identifier?

9Z3NGD45Z.

Q10. What is the story shared identifier?

JJ57Z8NDB.

Q11. Which technologies are visible in the website source?

HTML, CSS, JavaScript, Bootstrap asset references, Bootstrap Icons, Google Fonts and Tableau's JavaScript embed API.

Q12. Why use Tableau embeds?

They allow the website to present the published interactive dashboard and story without rebuilding the visualization interface in the page.

Q13. How is responsiveness handled?

CSS media queries adjust layout at 991px and 575px breakpoints, while JavaScript applies different embed heights for mobile and desktop.

Q14. Does the supplied source show a database or backend?

No. The supplied HTML shows a static presentation page and Tableau Public embeds; it does not show a custom backend or database.

Q15. Does the HTML identify the dataset source?

No. The dataset provider and source URL are not stated in the supplied HTML.

Q16. What does 6,464 race outcomes mean exactly?

The website uses that KPI label, but the underlying record grain is not defined in the HTML. The precise interpretation should be confirmed from the dataset or Tableau workbook.

Q17. Can points be compared directly across all seasons?

Comparisons across seasons need care because championship scoring rules and formats can change. The supplied HTML does not state a normalization method.

Q18. What is a dashboard?

A collection of visualizations arranged together so users can explore multiple analytical perspectives.

Q19. What is a Tableau Story?

A sequence of Tableau views used to guide a viewer through a focused analytical narrative.

Q20. What are the main limitations of the supplied documentation?

The HTML does not provide dataset provenance, exact season years, field-level schema, metric formulas, exact worksheet titles, chart values or runtime performance measurements.

Q21. What improvements can be made?

Document data sources and formulas, add verified written insights, improve accessibility, test responsive embeds and publish reproducible data-preparation details.

Q22. How would you verify the project?

Open both Tableau views, inspect the nine dashboard views, test Top N, compare KPI values with the workbook and test the website on desktop and mobile.

Q23. What is the key takeaway?

The project combines a broad Formula 1 dashboard with a focused driver-points leaderboard and presents both through a responsive website.
